Art Unit: 1743

DETAILED ACTION

This Office Action is in rsponse to Applicants' remarks filed on September 24, 2004. Claims 1-10 and 12-25 are pending.

Claim Rejections - 35 USC § 103

- 1. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.
- 2. Claims 1-9, 16-19, 23 and 25 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kanakkanatt '643 in view of <u>Journal of Physical Chemistry</u> article "Photochromism and Thermochromism driven by Intramolecular Proton Transfer in Dinitrobenzyl pyridine Compounds" authored by Corval et al.

Kanakkanatt '643 dicloses packaging materials containing dyes to be used to indicate possible spoilage and indicate that a package has been exposed to undesirably high or low temperatures (See abstract). At page 2, lines 18-21, Kanakkanatt '643 discloses incorporation of photochromic dyes into polymeric materials (matrix) as recited in claim 1. When the photochromic dye is exposed to specific stimuli, such as UV light, a color change in the dye results. At page 3, lines 9-22, Kanakkanatt '643 discloses using the dyes in packaging materials, as recited in claim 2. At page 5, lines 29-38, the reference teaches that the color change that results may be reversible where the matrix is to be used again. Regarding claims 16-19, Kanakkanatt '632 teaches that the dye materials may be affixed to (as in a substrate) or incorporated into the packaging materials or may be included as a coating (page 6, lines 31-37). With respect to claims 3, 7 and 9, Kanakkanatt '643 provides examples 1-5, wherein indicator dyes are incorporated into polymeric materials and due to the interactions of the substituent

Art Unit: 1743

group of the dye, a reversible color change forms. These reactions are a result of transferring of different molecules upon contact with UV light. At page 3, lines 17-19, Kanakkanatt '643 teaches that the color change of the photochromic dye may be temporary to denote successful irradiation completion. In example 1 of the reference, a photochromic dye is used as an indicator. Upon exposure to UV light, the indicator changes colors and then returned to the original color (clear). This reversible color change is similar to Applicants' claimed "discoloration following photo-induced coloration".

Kanakkanatt '643 fails to disclose "crystalline" photochromic dyes that respond as a function of time and temperature.

Corval et al teach 2-(2, 4-dinitrobenzyl) pyridine (having the formula of claim 4 and shown in the reference as structure 1) and 2-(2, 4-dinitrobenzyl)- 1, 10-phenanthroline (having the formula of claim 5 and shown in the reference as structure 6). The article teaches that these compounds undergo a photochromic process from a photon transfer reaction. The article further teaches that DNBP undergoes thermochromism (temperature dependent response). It would have been obvious to one of ordinary skill in the art to use these compounds in the packaging materials of Kanakkanatt '643 due to their unique ability to change visually in response to radiation light and in response to temperature. Both the compounds of Corval et al and those disclosed by Kanakkanatt are photochromic indicators. Substitution of one compound for another known for the same use would have been well within the skill of the ordinary artisan. See MPEP 2144.06. In using such compounds, an effective indicator of spoilage in food products can be provided.

Therefore, for the reasons set forth above, Applicants' claimed invention is deemed to be obvious over Kanakkanatt '643 in view of Corval et al.

Art Unit: 1743

9. Claims 10, 12-15, 20-22 and 24 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kanakkanatt '643 in view of US Patent 3,999,946 to Patel et al.

The disclosure of Kanakkanatt '643 is given above.

Kanakkanatt '643 does not disclose the additional use of a non-reversible indicator.

Patel et al '946 teach indicator compositions to be used in packaging materials to determine whether perishable items have been exposed to undesirable time – temperature history. Patel et al '946 use indicator dyes whose color change is irreversible, as recited in claim 12. Regarding claims 13 and 14 and 22. Patel et al '946 teach using a filter material with the indicator to eliminate undesirable photo-induced reactions (col. 8, lines 5-8). At col. 12, lines 7-9, Patel et al '946 use a reference chart to compare the resulting color, as in claims 15, 20 and 24.

It would have been obvious to one of ordinary skill in the art to use both a reversible indicator dye and an irreversible indicator dye because use of such would allow instant indication of undesirable time temperature conditions and simultaneously serve as a recording device to show a history of the time temperature conditions.

Response to Arguments

Applicant's arguments filed 7-11-03 have been fully considered but they are not persuasive. With respect to the Kanakkanatt reference, Applicants' argue neither the indicators of Kanakkanatt nor those of Corval et al are photochromic time and temperature dependent indicators. In response, the Examiner would like to note that Kanakkanatt teaches photochromic indicators being incorporated into food packaging material. While, the indicators of Kanakkanatt may not be both time and temperature indicators, Corval teaches

Art Unit: 1743

photochromic indicators that are the same as those instantly claimed. Corval recognizes that the DNBP indicators are both photochromic and thermochromic. Since they are the same as those claimed by Applicants, then their properties (i.e. ability to indicate according to time and temperature) must be the same.

Applicants argue that even if the compounds of Corval are those instantly claimed, the article does not disclose the claimed properties. In response, MPEP 2112.01 explains that product of identical chemical composition cannot have mutually exclusive properties. Absent evidence that the compounds of Corval are not those instantly claimed, the position of the Examiner continues to be that the compounds of Corval have properties that allow them to be both time and temperature indicators.

Further, Applicants question the combination of Corval with Kanakkanatt, stating that there exists no motivation for incorporating the compounds of Corval into packaging materials. Kanakkanatt teaches that photochromic and thermochromic dyes can be incorporated into packaging material to indicate contamination or spoilage. Corval teaches dyes that are both photochromic and thermochromic. Given the teaching in Kanakkannatt that dyes having photochromic and thermochromic properties can be incorporated into packaging material to aid in determining contamination or spoilage, one of ordinary skill in the art would have been motivated to incorporate those dyes of Corval (which are taught to have both photochromic and thermochromic properties) into packaging material.

Applicants pointed out the Examiner's error in distinguishing which claims were rejected in the previous Office Action. For clarification, all claims are currently rejected, as set forth above.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to LaToya I. Cross whose telephone number is 571-272-1256. The examiner can normally be reached on Monday-Friday 8:30 a.m. - 5:00 p.m.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Jill A. Warden can be reached on 571-272-1267. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
